

Introduction to LangChain

LangChain is a framework for building applications powered by large language models (LLMs).

It helps developers connect LLMs with external data sources, APIs, and tools.

Key components include LLMs, Prompts, Chains, Agents, and Memory.

Chains allow you to link multiple LLM calls or tools together.

Agents enable LLMs to decide which tools to use dynamically.

Memory helps models remember past interactions in a conversation.

LangChain is widely used for chatbots, RAG systems, and AI assistants.
